# Update from CDC: Phthalates and Phthalate Alternatives

Antonia M. Calafat

Organic Analytical Toxicology Branch
Division of Laboratory Sciences
National Center for Environmental Health

Biomonitoring California Scientific Guidance Panel Meeting July 16, 2015 Oakland, CA

#### **Outline**

- Phthalates exposure generalities
- Changes in exposures
  - Use of NHANES
  - Archived samples: DINCH example
  - German Environmental Specimen Bank
- Selection of phthalate biomarkers
  - DiNP
  - DBP and DiBP
- Toxicology vs exposures
  - DPP
- Future work

#### What are Phthalates?

- Widely used industrial chemicals
  - As plasticizers of PVC
    - Miscellaneous products
    - Medical devices, tubing and blood bags
  - In consumer & personal care products
    - Fragranced products, cosmetics
    - Paints, ink & lacquers
    - Medications
- Adverse health outcomes in experimental animals exposed to high doses of phthalates
- Emerging data on potential human effects at background exposure levels
- Metabolites as biomarkers of exposure

# The Human Exposure Scenario

- Controlled conditions, as in animal studies, do not apply
- Numerous and even unknown exposure routes and sources
- Unknown dose, duration, frequency and timing
- People exposed to chemical "cocktails" (multiple/mixtures)
- Biomonitoring to assess exposures

# **CDC's Phthalates Biomonitoring Program Areas**

- Assess exposure to phthalates & alternatives
- Assess associations between exposure & health
- R&D to improve Biomonitoring practices
  - Develop analytical methods
  - Identify & validate biomarkers
    - Replacement chemicals
  - Develop Standard Reference Materials
- Capacity building
  - Public Health Laboratories: Performance testing

## **Biomonitoring Methods**

#### **General requirements**

- Sensitive
- Specific/Selective
- Accurate
- Precise

#### **Biomonitoring-specific**

- Minimum sample volume
  - Reduce solvent use & waste
- Multianalyte & highthroughput
  - Increase efficiency
- Reproducible
- Include QA/QC program
  - Accountability
- Automated
  - Cost effective

# **Best compromise**

# **Accuracy: The Importance of Quantification**

- Analytical standards
  - Custom synthesis
- Analytical method
- Well-maintained instrumentation
- Trained personnel
- External Quality Assessment Programs
  - G-EQUAS (<a href="http://www.g-equas.de/">http://www.g-equas.de/</a>)
    - Four DEHP metabolites, MnBP, MiBP, MBzP
  - Accuracy of standards (neat vs solution)

Journal of Analytical Toxicology 2012;36:270-279 doi:10.1093/jat/bks016

Article

#### **Accuracy Investigation of Phthalate Metabolite Standards**

Eric Langlois\*, Alain LeBlanc, Yves Simard and Claude Thellen

Centre de Toxicologie du Québec (CTQ), Institut National de Santé Publique du Québec (INSPQ), Québec, Québec, G1V 5B3, Canada

#### **Standard Reference Materials**

#### NIST SRMs

- Urine from smokers (3672)
- Urine from non-smokers (3673)
- First frozen urine reference materials characterized for organic environmental contaminants
  - 11 phthalate metabolites

Table 2. Reference Mass Fraction Values for Selected Phthalate Metabolites in SRM 3672

Phthalate Metabolites	Mass Fraction <sup>(a,b)</sup> (μg/kg)
Mono-carboxynonyl phthalate isomers <sup>(c)</sup>	1.92 ± 0.06
Mono-carboxyoctyl phthalate isomers <sup>(d)</sup>	$21.3 \pm 1.1$
Mono-(2-ethyl-5-carboxypentyl) phthalate	$35.2 \pm 1.7$
Mono-(2-ethyl-5-hydroxyhexyl) phthalate	$24.8 \pm 0.4$
Mono-(2-ethyl-5-oxohexyl) phthalate	14.9 ± 0.4
Mono-(2-ethylhexyl) phthalate	$4.13 \pm 0.15$
Mono-(3-carboxypropyl) phthalate	2.99 ± 0.20
Monobenzyl phthalate	8.37 ± 0.18
Monoethyl phthalate	94.5 ± 3.0
Mono-isobutyl phthalate	6.40 ± 0.28
Mono-n-butyl phthalate	$10.6 \pm 0.5$

# State Biomonitoring Cooperative Agreements

- Technical support (2009+)
  - Training
  - Site visits
  - Advisory services

- Quality assurance programs (2012+)
  - In-kind performance testing
    - Phthalates & other plasticizers
    - PAHs
    - Environmental Phenols & PCPs
    - Pesticides
      - Universal Pesticides
      - Dialkyl Phosphates
    - PFCs

States  Non-participating state Individually-funded sta	
Consortia	🗙 Consortium lead
Four corners states co	nsortium

# **Exposure to Phthalates in the United States**

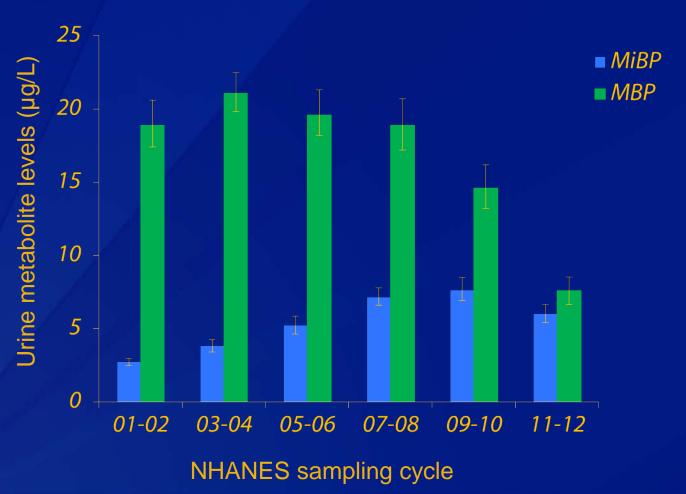

## ■ Most Americans (6+ years) are exposed NHANES 2011-2012

Compound	Detection frequency (%)
DEHP	100
DiNP	100
DiDP	99
BBzP	98
DnBP	94
DiBP	99
DEP	100

n=2,489

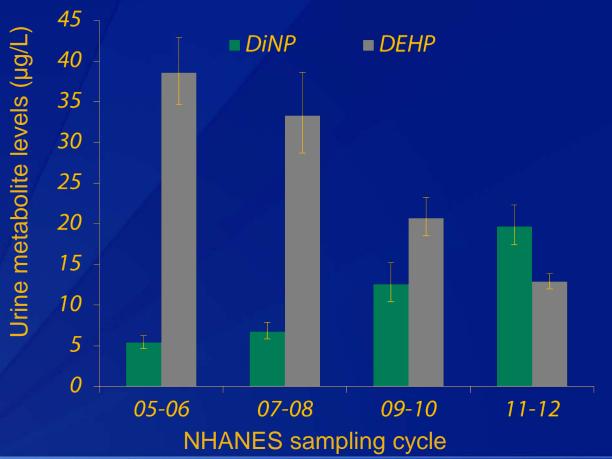

# Is Americans' Exposure to Phthalates Changing?

- **■** Some exposures increased: DiBP († 121%)
- Other exposures decreased: DBP (\$\square\$-60%)

# Americans' Exposures Change across Phthalates

- **■** Some exposures increased: DiNP (↑265%)
- Other exposures decreased: DEHP (1-67%)
  - Legislative actions and public scrutiny

#### Other Plasticizers: DINCH

- Phthalate alternative introduced in Europe in 2002
- DEHP replacement
  - Toys, medical devices, food packaging
- Metabolites as exposure biomarkers

# **Are Exposures to DINCH Changing?**

- Convenience U.S. adult sampling (2000-2012)
  - DINCH metabolites
  - Undetected in 2000-1
  - Increasing detection frequency after 2001
  - Increasing concentrations
- Similar resultsobserved in Germany

# DINCH metabolite (OH-MINCH) urinary concentrations

Year	N	Detection frequency (%)	50 <sup>th</sup> (μg/L)	95 <sup>th</sup> (µg/L)
2000	114	0	<lod< td=""><td><lod< td=""></lod<></td></lod<>	<lod< td=""></lod<>
2001	57	0	<lod< td=""><td><lod< td=""></lod<></td></lod<>	<lod< td=""></lod<>
2007	23	4	<lod< td=""><td><lod< td=""></lod<></td></lod<>	<lod< td=""></lod<>
2009	118	8	<lod< td=""><td>0.5</td></lod<>	0.5
2011	94	13	<lod< td=""><td>1.5</td></lod<>	1.5
2012	121	19	<lod< td=""><td>1.4</td></lod<>	1.4

LOD: 0.4 µg/L

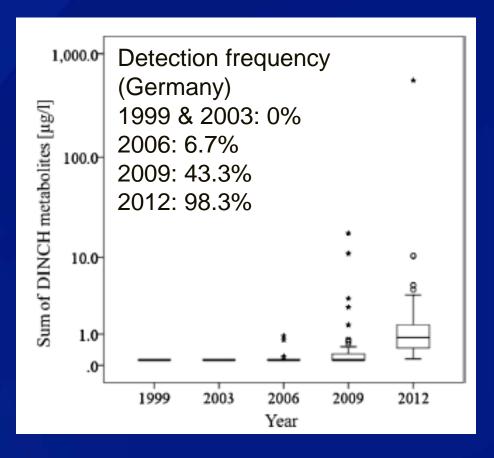

# **DINCH General Population Data**

#### **Germany**

- ESB
  - 24-h urine samples
  - College students
  - 60 samples/year
  - 4 metabolites

### <u>USA</u>

- NHANES 2011-2
  - Spot sample
  - 6+ years old
  - One metabolite (OH-MINCH)
  - Detection frequency: 24% (605/2489)
  - Range: <LOD (0.4 μg/L) to 168 μg/L</p>

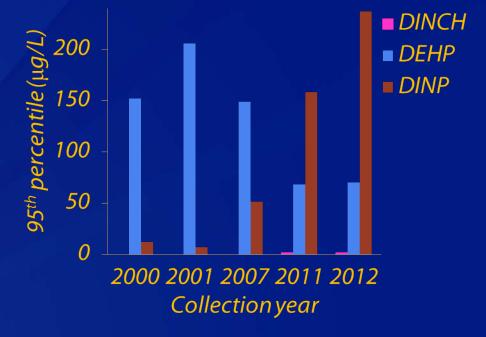

# **Are DINCH and Other Phthalates Replacing**

#### **DEHP?**

- DINP/DEHP trends in convenience samples
  - US & German general population
- DINCH & DINP may be replacing DEHP
  - Isomeric compounds
  - Starting with NHANES 2013-4, CDC will include another DINCH

isomer

# Monitoring Changes in Phthalates Exposures

- Constantly evolving
- Identification of biomarkers
  - In-vitro metabolism
  - In-vivo animal studies
  - Human studies
    - University of Bochum, Germany
- Biomarkers choice
- Access to archived urine
  - Convenience samples
  - General population samples

# **Analyte vs Exposure Biomarker**

Many analytes can be measured simultaneously, but additional information is needed to demonstrate the utility of these analytes as exposure biomarkers

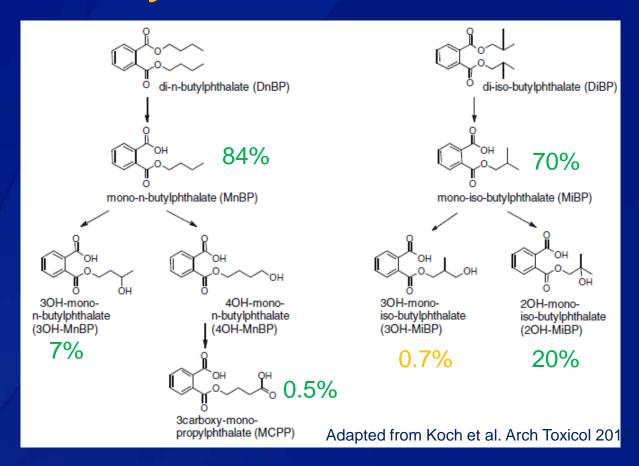

# Selection of Exposure Biomarkers: DINP Example

- DINP metabolites: MNP (~2%) and MCOP (~11%)
- MNP (minor metabolite): insensitive biomarker of DINP background exposures

Unweighted number of		MCOP urinary concentrations		
participants (we percentage)	pants (weighted Detectable Non-detectable To		Total	
MNP urinary	Detectable	347 (12.9%)	2 (0.02%)	349 (12.9%)
	Non-detectable	2100 (82.4%)	99 (4.7%)	2199 (87.1%)
	Total	2447 (95%)	101 (5%)	

- Select most abundant/relevant biomarker to minimize exposure misclassification
  - 82.4% of persons classified as exposed to DINP are misclassified based on urinary concentrations of MNP only

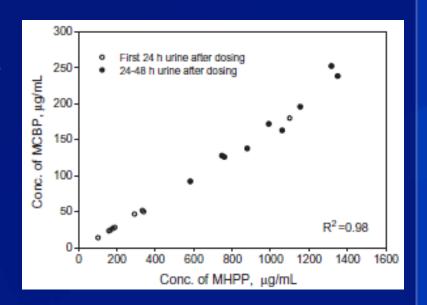

# **Dibutyl Phthalates in NHANES**

- NHANES 1999-2000: MBP (MnBP + MiBP)
- NHANES 2001-12: MnBP & MiBP
- □ NHANES 2013+: MnBP, MiBP, 3OH-MnBP, 2OH-MiBP

# Toxicology vs Exposure: Dipentyl Phthalate (DPP)

- Nitrocellulose plasticizer
  - Plastic film, inks & wood coatings
- Testicular toxicant in rats
- In-vivo metabolism in rats
  - Nine rats
  - Single oral dose (500 mg/Kg)
  - Urine collected 24-h & 48-h after dose

#### DPP metabolite median urinary concentrations (µg/mL)

Metabolite	24-h post dose	48-h post dose
MPP	222	<i>75</i>
MHPP	993	191
МСВР	168	29

# **Human Exposure to Dipentyl Phthalate (DPP)**

- Forty-five spot samples
- Anonymously collected in 2009 from adults
  - Relatively low detection frequency for MHPP (specific)
  - No correlation between MHPP & MCBP/MCPP
- □ Limited exposure to DPP in US adults

DPP metabolite urinary concentrations			
Metabolite	% Detection	Min (µg/L)	<i>Max</i> (μ <i>g/L</i> )
MPP	0	NA	NA
MHPP	29	<lod< td=""><td>8</td></lod<>	8
MCBP	4	<lod< td=""><td>221</td></lod<>	221
МСРР	13	<lod< td=""><td>40</td></lod<>	40

# What Exposure Biomarkers Should We Measure?

#### Analytical method

- Can we add more analytes?
- Instrumentation
  - DiDP vs Bis-(2-propylheptyl)phthalate (DPHP)

#### Toxicokinetics

- Abundance
- Specificity

#### Target population

- Exposures can be population-specific
  - Age-dependent

#### Nature of exposure

Background vs specific exposures

## **Take Home Messages**

- Americans are exposed to phthalates
- Market changes in commercial formulations
  - Introduction of replacement chemicals
    - Phthalates (e.g., DiNP)
    - Non-phthalates (e.g., DINCH)
  - Changing exposures
- Biomonitoring & biomarkers toxicokinetics
  - Specificity
  - Abundance
- Method adequate for intended purpose
- Banking of urine
  - Trends evaluation

#### **Future Work**

- Continue NHANES & studies on targeted populations
  - Track exposures to "legacy" & replacement chemicals
  - Fill in data gaps to better understand temporal trends and underlying reasons
- Identify & incorporate phthalate and phthalate replacement biomarkers
